

MARCH SPECIAL #3

LINAK Actuator -

Save a big 20%

off normal price

The Linak is a reliable electrical linear actuator device that converts the rotational motion of a low voltage DC motor into linear motion - that is push & pull movements. In use, a power cylinder provides forward and backwards linear motion up to a defined maximum stroke.

Electro-mechanical linear actuators are an ideal alternative in place of more traditional hydraulic systems. The self-contained nature of these powerful components eliminates the potential for oil leaks, improving reliability and reducing maintenance time.
